Some More nmr

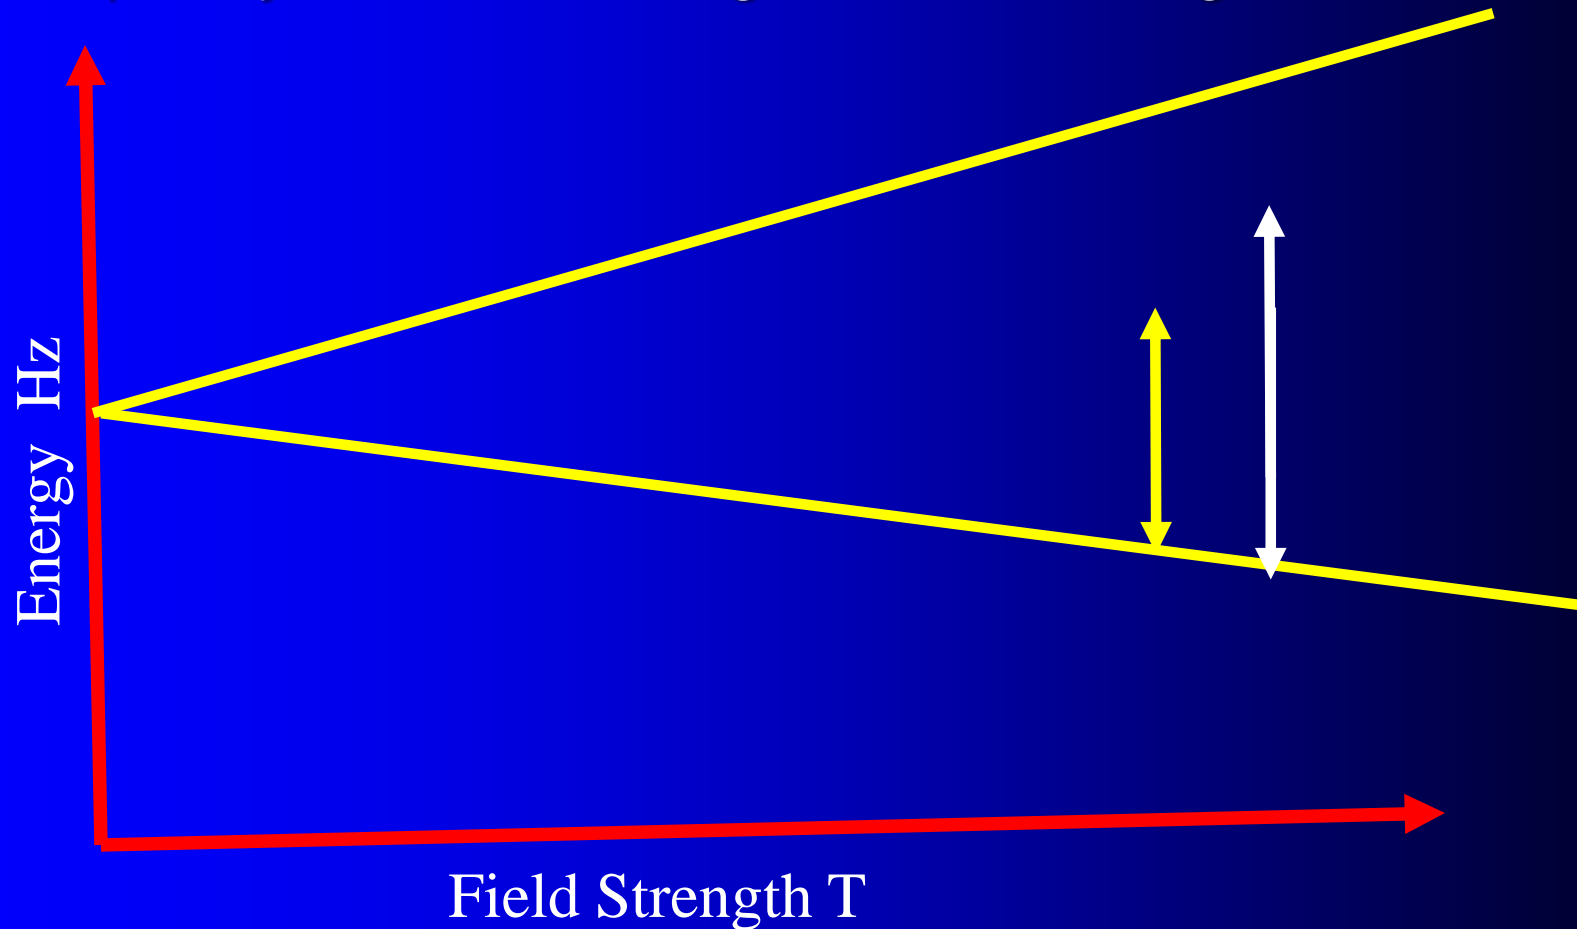

Conducting loops and magnetic fields
“conventional” current??

<http://www.mi.mun.ca/users/cchaulk/eltk1100/ivse/ivse.htm>

Resonance can be achieved by changing the magnetic field strength at constant frequency ...or by changing frequency at constant magnetic field strength

The 100MHz nmr Chart

field ← Frequency →

The TMS resonance is defined as having “0” frequency

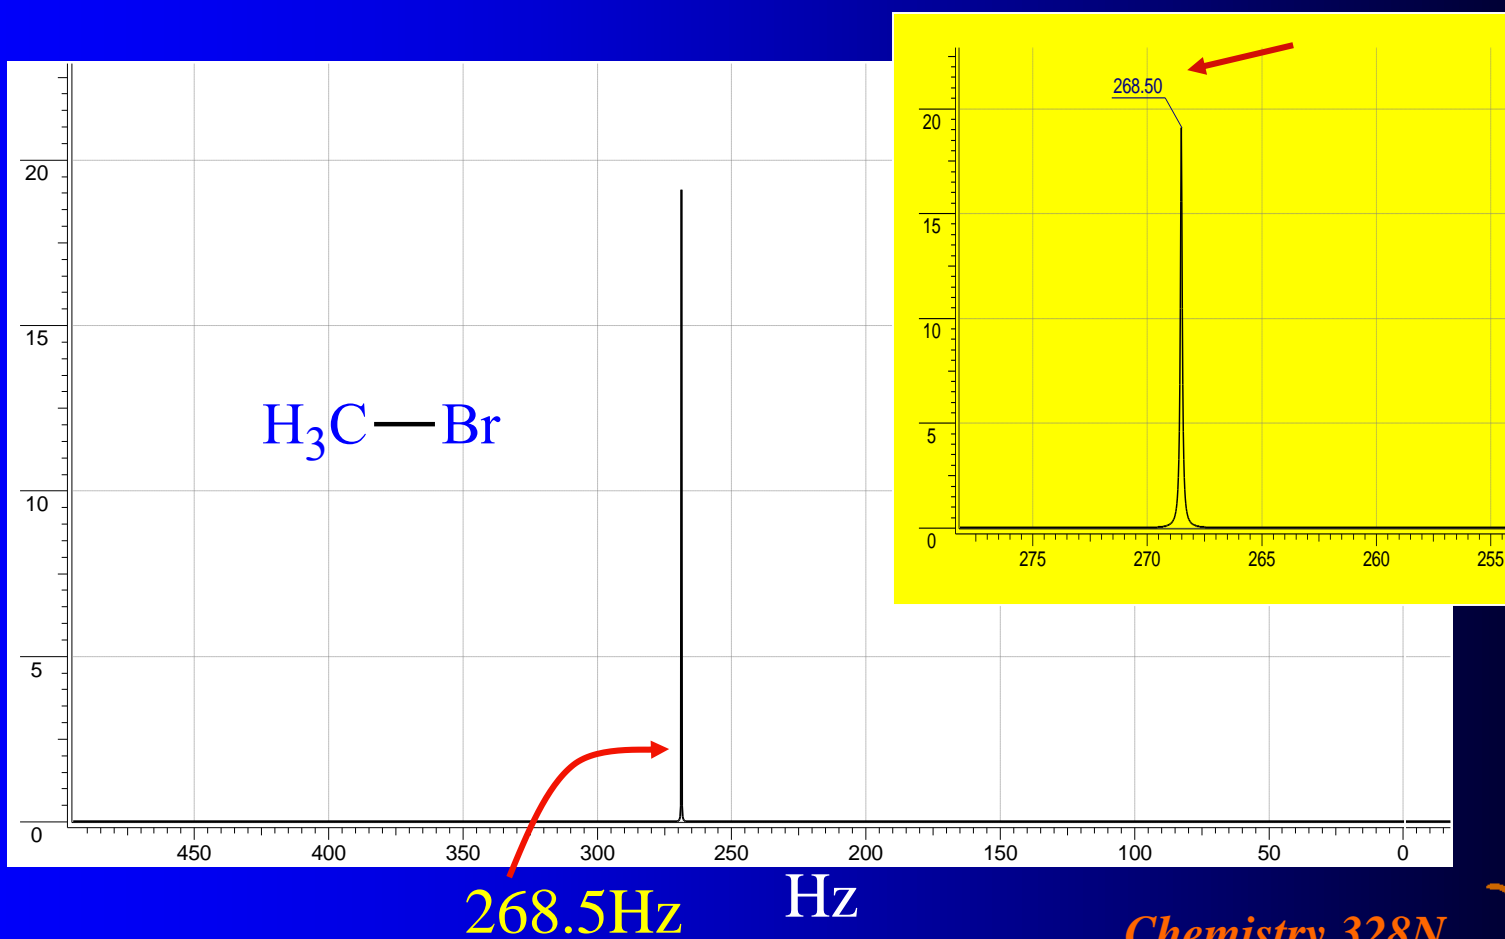

100MHz Spectrum

304 Hz Hz

100MHz nmr Spectrum

Chemical Shift

- The difference in resonance frequencies for hydrogens in CH_3Cl compared to CH_3Br under an applied field of 2.34T is only 35.5Hz, which is 0.35 parts per million (ppm) compared with the irradiating frequency

$$\frac{35 \text{ Hz}}{100 \times 10^6 \text{ Hz}} = \frac{0.35}{10^6} = 0.35 \text{ ppm}$$

Here, 35Hz is the difference in resonance frequency and 100MHz is the ^1H resonance frequency for $B=2.34\text{T}$ and $\gamma = 42.58 \text{ MHz / Tesla}$

Calculating Chemical Shift

At 7.05 T, a resonance is at 715 Hz (from TMS)

1. What is the spectrometer frequency?

$$\nu = \gamma B = (42.5 \text{ MHz/T})(7.05 \text{ T}) = 300 \text{ MHz}$$

2. What is the chemical shift in ppm???

$$\frac{715 \text{ Hz}}{300 \times 10^6 \text{ Hz}} = \frac{2.38}{10^6} = 2.38 \text{ ppm}$$

Chemical Shift

- Depends on several things (1) **electronegativity** of nearby atoms, (2) the **hybridization** of adjacent atoms, and (3) **magnetic induction** within an adjacent pi bond
- (1) Electronegativity

CH₃-X	Electronegativity of X	δ of H
CH₃ F	4.0	4.26
CH₃ OH	3.5	3.47
CH₃ Cl	3.1	3.05
CH₃ Br	2.8	2.68
CH₃ I	2.5	2.16
(CH₃)₄ C	2.1	0.86
(C H₃)₄ Si	1.8	0.00 (by definition)

Chemical Shift

- (2) The Hybridization of C Effects ^1H chemical Shift

Hybrid	Type of H	Name	δ
sp^3	RCH_3	alkyl	0.8- 1.0
sp	$\text{RC}\equiv\text{CH}$	acetylenic	2.0 - 3.0
sp^2	$\text{R}_2\text{C}=\text{CH}_2$	vinyllic	4.6 - 5.7

This seems like a Mystery!!

Magnetic field induced in the pi bonds if a carbon-carbon triple bond

is this arrow correct for electron flow???

Induced flow of electrons in the pi system of alkyne

Induced local magnetic field of the pi electrons is against the applied field; it requires a greater applied field to bring an acetylenic hydrogen into resonance.

Induced field
opposes big magnet
inside the ring

Magnetic field induced in the pi bond of a carbon-carbon double bond

^1H -nmr spectrum of benzene

Chemical Shift

- Magnetic induction in pi bonds of a....
 - a carbon-carbon triple bond shields an acetylenic hydrogen and shifts its signal upfield (to the right) to a smaller δ value
 - carbon-carbon double bond deshields vinylic a hydrogens and shifts their signal downfield (to the left) to a larger δ value

Chemical Shift - $^1\text{H-NMR}$

Type of H	δ	Type of H	δ
$(\text{C H}_3)_4 \text{Si}$	0	ROH	0.5-6.0
RCH_3	0.9	$\text{RCH}_2 \text{OR}$	3.3-4.0
$\text{RCH}_2 \text{R}$	1.2-1.4	$\text{R}_2 \text{NH}$	0.5-5.0
$\text{R}_3 \text{CH}$	1.4-1.7	$\begin{array}{c} \text{O} \\ \\ \text{RCCH}_3 \end{array}$	2.1-2.3
$\text{R}_2 \text{C}=\text{CRC HR}_2$	1.6-2.6	$\begin{array}{c} \text{O} \\ \\ \text{RCCH}_2 \text{R} \end{array}$	2.2-2.6
$\text{RC}\equiv\text{CH}$	2.0-3.0		
ArCH_3	2.2-2.5		

Chemical Shift - $^1\text{H-NMR}$

Type of H	δ	Type of H	δ
$\begin{array}{c} \text{O} \\ \parallel \\ \text{RCOCH}_3 \end{array}$	3.5-3.9	$\text{R}_2\text{C}=\text{C H}_2$	4.6-5.0
$\begin{array}{c} \text{O} \\ \parallel \\ \text{RCOCH}_2\text{R} \end{array}$	4.1-4.7	$\text{R}_2\text{C}=\text{C HR}$	5.0-5.7
RCH_2I	3.1-3.3	ArH	6.5-8.5
RCH_2Br	3.4-3.6	$\begin{array}{c} \text{O} \\ \parallel \\ \text{RCH} \end{array}$	9.5-10.1
RCH_2Cl	3.6-3.8	$\begin{array}{c} \text{O} \\ \parallel \\ \text{RCOH} \end{array}$	10-13
RCH_2F	4.4-4.5		

Integration

“up field”

Equivalent Hydrogens

- Have exactly the same chemical environment

1,1-Dichloroethane

2 signals

Cyclopentanone

2 signals

(Z)-1-Chloropropene

3 signals

Cyclohexene

3 signals

How many equivalent hydrogens??

This looks “easy” but it is not!!

Changing Spectrometers

- If the resonance of the peak on a 7.05 T instrument is 715 Hz, what will the resonance frequency be at 23.5 T
- What is the resonance in ppm at 7.05 T ?
- What is the resonance in ppm at 23.5 T?

Chemical shift in ppm (δ) is independent of field strength!

Frequency
Field
Up Field

Down Field

Ethyl Acetate

Signal Splitting

Huh?? Why??? What is going on here??

What a mess.

- **Signal splitting:** splitting of an NMR signal into a set of peaks by the influence of neighboring nonequivalent hydrogens
- This splitting business is actually rich in information...it is a wonderful thing!

Origins of Signal Splitting

- When the chemical shift of one nucleus is influenced by the spin of another, the two are said to be *coupled*
- Consider nonequivalent hydrogens H_a and H_b on adjacent carbons
 - the chemical shift of H_a is influenced by whether the spin of H_b is aligned with or against the applied field

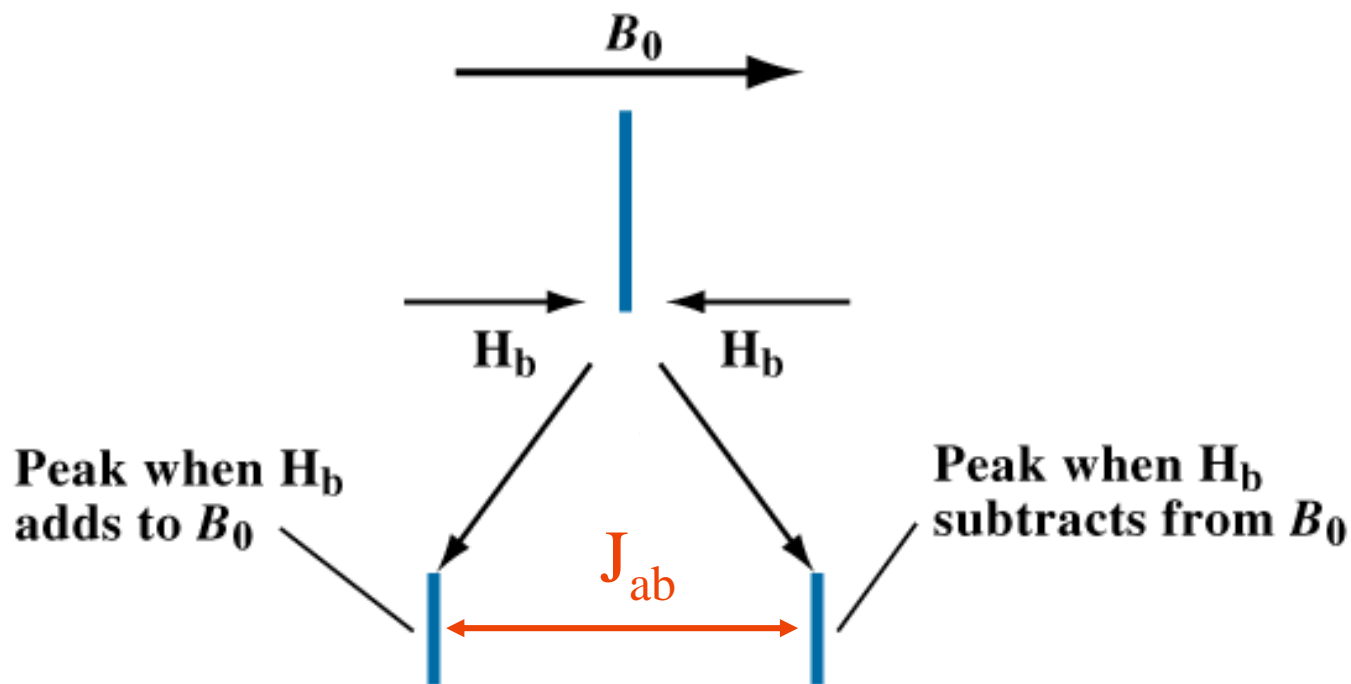

Origins of Signal Splitting

Remember...it is the **NET** field that counts

The signal of H_a is split into two peaks of equal area (a doublet)

J_{ab} = coupling constant

Origins of signal splitting

no neighbors

one spin

two spins

three spins

Relative Intensity of Peaks

singlet	1
doublet	1 1
triplet	1 2 1
quartet	1 3 3 1
quintet	1 4 6 4 1
sextet	1 5 10 10 5 1

Pascal's triangle

The binomial coefficients

The “N+1 Rule”

- The ^1H -NMR signal of a hydrogen or set of equivalent hydrogens is split into $(N + 1)$ peaks by a set of N equivalent neighboring hydrogens
 - All neighboring hydrogens in the analysis must have the same chemical shift (magnetically equivalent)
 - If this condition is not met, a graphical tree or second order analysis must be used to predict the splitting pattern. We will explore this condition later

NMR Splitting Patterns

n+1

Who needs DNA??
